MATLAB offers the Robotics System Toolbox, which supports robot simulation and control, and can be extended with custom interfaces to communicate with KUKA robots via TCP/IP or UDP. Additionally, third-party MATLAB toolboxes like KUKA MATLAB Toolbox provide dedicated functions for KUKA robot control.

Can I simulate KUKA robot trajectories directly in MATLAB before deployment?

Yes, MATLAB allows you to simulate KUKA robot trajectories using the Robotics System Toolbox and custom kinematic models. This helps in validating motion plans and ensuring safe operation before deploying commands to the actual robot.

What are the common challenges when controlling KUKA robots from MATLAB?

Common challenges include ensuring real-time communication and synchronization, handling network latency, managing safety protocols, and translating MATLAB commands into robot-specific control instructions. Proper setup of network configurations and using dedicated APIs can mitigate these issues.

Are there any recommended best practices for developing KUKA control applications in MATLAB?

Best practices include establishing reliable communication protocols, validating robot models through simulation before deployment, implementing error handling routines, and ensuring compliance with safety standards. Additionally, using modular code and leveraging existing toolboxes can streamline development and improve robustness.
