External Anatomy of the Rat

Understanding external features is essential as they provide clues about the internal structure and health of the specimen.

Main External Features

- Head:** Contains sensory organs, mouth, and auditory structures.
- Thorax:** The chest region housing the heart and lungs.
- Abdomen:** Contains digestive and reproductive organs.
- Limbs:** Forelimbs and hind limbs used for movement.
- Tail:** Composed of vertebrae, aids in balance and communication.

External Features and Their Functions

Preparation for Dissection

Before dissection, ensure all tools are sterilized, and the workspace is prepared. Proper handling is crucial for safety and preserving the specimen.

Tools Required:

- Scalpel or dissecting scissors
- Forceps
- Dissecting pins
- Scalpel handle
- Dissecting tray
- Gloves and safety goggles

Dissection Procedure Overview:

Anesthetize and euthanize the rat ethically. Place the rat on the dissecting tray. Use scissors or scalpel for initial incisions. Carefully expose internal organs, noting their positions and relations.

Internal Anatomy and Organ Systems

The internal anatomy of the rat reveals complex organ systems working together to sustain life.

1. Circulatory System

Main Components:

- Heart
- Arteries and veins
- Capillaries

Key Notes:

The heart is a four-chambered organ, similar to humans. The right atrium receives deoxygenated blood; the left atrium receives oxygenated blood. The aorta carries oxygen-rich blood to the body. The vena cava returns deoxygenated blood to the heart.

Dissection Points:

Locate the heart in the thoracic cavity. Observe the major arteries and veins connected to it.

2. Respiratory System

Main Components:

- Lungs
- Trachea
- Diaphragm

Key Notes:

The lungs are paired, spongy organs located in the thoracic cavity. The trachea is a tube connecting the larynx to the bronchi. The diaphragm aids in breathing by changing the thoracic cavity volume.

Dissection Points:

Open the thoracic cavity to view lungs. Identify trachea and bronchi.

3. Digestive System

Main Components:

- Mouth and salivary glands
- Esophagus
- Stomach
- Intestines (small and large)
- Liver
- Pancreas
- Cecum

Key Notes:

The stomach is located just below the diaphragm. The small intestine is long and coiled, involved in nutrient absorption. The large intestine absorbs water and

forms feces. The liver produces bile; the pancreas produces digestive enzymes. Dissection Points: Trace the esophagus from the mouth to the stomach. Identify the liver and gall bladder. Follow the small intestine to the large intestine.

4. Urinary System

Main Components: Kidneys, Ureters, Bladder, Urethra

Key Notes: Kidneys are bean-shaped organs located near the dorsal wall. Ureters carry urine from kidneys to the bladder. The bladder stores urine until excretion.

Dissection Points: Locate and observe the kidneys. Follow the ureters to the bladder.

5. Reproductive System

In Male Rats: Testes, Epididymis, Seminal vesicles, Penis

In Female Rats: Ovaries, Uterine horns, Vagina

Key Notes: Reproductive organs are located in the pelvic region. In males, testes are external and scrotal. In females, the ovaries are paired and connected to the uterus.

6. Nervous System

Main Components: Brain, Spinal cord, Nerves

Key Notes: The brain is protected by the skull. The spinal cord runs through the vertebral column. Nerves extend to various parts of the body.

Dissection Points: Carefully expose the brain from the cranial cavity. Observe the spinal cord at the dorsal side of the vertebral column.

Key Questions and Answers for Rat Dissection

Understanding common questions helps reinforce learning and prepares students for assessments.

Q1: How do you distinguish between the small and large intestine? **Answer:** The small intestine is longer, more coiled, and has a narrow lumen, while the large intestine is shorter, wider, and has a more distinct lumen. The large intestine also contains the cecum, which appears as a sac-like structure at the junction with the small intestine.

Q2: What is the function of the liver in the rat? **Answer:** The liver produces bile, which aids in digestion of fats, detoxifies harmful substances, stores glycogen, and regulates blood glucose levels.

Q3: How can you identify the rat's heart during dissection? **Answer:** The rat's heart is located in the thoracic cavity, between the lungs, and has a muscular, four-chambered structure. It appears as a reddish, conical organ with visible arteries and veins attached.

Q4: What are the main differences between rat and human respiratory systems? **Answer:** While both have similar structures like trachea, bronchi, and lungs, rats have a more elongated nasal cavity and different respiratory rates. The basic architecture is comparable, making rats a good model for respiratory studies.

Q5: Why is the diaphragm important in the rat's respiratory system? **Answer:** The diaphragm is a muscular sheet that contracts and relaxes to change the volume of the thoracic cavity, enabling the rat to breathe by drawing air into and expelling air from the lungs.

Summary and Tips for Effective Dissection

Dissection is a meticulous process requiring patience and attention to detail. Here are some tips: Always handle tools carefully to avoid damaging organs. Use dissection pins to secure the specimen and expose structures clearly. Refer to notes and diagrams regularly. Wear appropriate protective gear. Label organs as you identify them to aid in revision. Observe the spatial relationships between organs for better understanding.
