Sample Problems and Solutions from Physics Study Guide 13 Answer Key Let's explore a few example problems you might find in the guide, along with summarized solutions to illustrate how the answer key supports your learning.

Example 1: Calculating Force in a Pulley System
Problem: A block of mass 5 kg is lifted using a pulley system. If the acceleration due to gravity is 9.8 m/s^2 , what is the force needed to lift the block at constant speed?
Answer Key Solution: Identify the force required: The weight of the block is given by $(W = m \times g = 5 \times 9.8 = 49 \text{ N})$. Since the block is lifted at constant speed, the net acceleration is zero, so the applied force equals the weight. Therefore, the force needed is 49 N. This example demonstrates the straightforward application of Newton's second law in equilibrium conditions.

Example 2:

Determining the Speed of a Wave Problem: A wave travels along a string with a wavelength of 2 meters and a frequency of 5 Hz. What is the wave's speed? **Answer Key Solution:** Use the wave speed formula: $v = f \lambda$. Calculate: $v = 5 \text{ Hz} \times 2 \text{ m} = 10 \text{ m/s}$. This illustrates how to connect wave properties using fundamental equations.

Key Events in Apollo 13 and the Underlying Physics

The Oxygen Tank Explosion

Physics Behind the Explosion: The oxygen tank, a cryogenic vessel, contained supercooled liquid oxygen. The explosion resulted from a combination of:

- Over-pressurization due to a thermostat switch issue.
- Material fatigue in the tank's heating elements.
- The rapid phase change and expansion of supercooled liquid oxygen caused mechanical failure.

Understanding pressure-volume relationships, governed by the ideal gas law, was crucial in analyzing the explosion.

Navigating Using Physics: The Lunar Trajectory and Course Corrections

The spacecraft's trajectory was manipulated using rocket thrusters based on Newton's Third Law: every action (firing thrusters) produced an equal and opposite reaction. Orbital mechanics calculations were essential for "free-return" trajectories, ensuring a safe return path around the Moon.

Power Conservation and Energy Management

With limited electrical power, engineers analyzed the conservation of energy to optimize battery usage. Thermal physics helped manage cabin temperature and prevent systems

from overheating. Engineering Solutions Rooted in Physics The LM (Lunar Module) as a Lifeboat The Lunar Module was repurposed as a life raft, with physics principles guiding: Thermal insulation to maintain habitable conditions. Propellant management for course adjustments. The "NASA Engineered Solution" The famous "squib switch" fix involved understanding electrical circuits and physics of ignition systems. Re-Entry Physics and Safe Return The re-entry phase involved understanding aerodynamics, heat transfer, and g-force impacts on astronauts. The heat shield had to withstand extreme temperatures due to atmospheric friction, a classic example of thermodynamics and fluid mechanics.

Study Tips for Mastering Apollo 13 Physics Concepts

Understand the Fundamental Laws: Focus on Newton's Laws, conservation principles, and thermodynamic laws. Visualize Trajectories: Use diagrams and simulations to grasp orbital mechanics. Relate Real-Life Applications: Connect physics concepts to the actual events of Apollo 13. Practice Calculations: Work through problems involving gas laws, momentum, and energy conservation. Use Multimedia Resources: Watch documentaries and animations that illustrate physics in space.

Sample Physics Problems Inspired by Apollo 13

Problem 1: The oxygen tank explosion increased the pressure inside the tank by 20%. Assuming the initial pressure was 2000 psi and temperature remained constant, what is the new pressure?
Solution: Using the pressure increase formula:

$$P_{\text{new}} = P_{\text{initial}} \times (1 + \frac{\Delta P}{P_{\text{initial}}})$$

$$P_{\text{new}} = 2000 \times (1 + 0.20) = 2000 \times 1.20 = 2400 \text{ psi}$$

Problem 2: If the spacecraft's velocity after a course correction burn was 1.5 km/s, and the mass of the spacecraft was 30,000 kg, what was the change in momentum caused by the thrusters?
Solution:

$$\Delta p = m \times \Delta v = 30,000 \times 1.5 \times 10^3 = 45,000,000 \text{ kg}\cdot\text{m/s}$$

Conclusion: The Legacy of Physics in Space Missions

The Apollo 13 Study Guide Pablo S Physics underscores the importance of physics not only in understanding space missions but also in solving real-world problems under extreme conditions. From the explosion of the oxygen tank to the delicate re-entry into Earth's atmosphere, physics principles guided every decision and maneuver.
