Explaining the Program Components

Pin Assignments and Sensor Connection

Connect the smoke sensor's output to analog input pin (PIN 1). Connect the buzzer to digital output pin (PIN 2). Connect the status LED to digital output pin (PIN 3).

Threshold Setting

The `SMOKE\_THRESHOLD` value (512) is based on ADC readings. Adjust this value depending on

your sensor calibration. Monitoring and Response The program continuously reads the smoke sensor. When the reading exceeds the threshold, it triggers the alarm subroutine. When smoke levels are below the threshold, it ensures the alarm is off. Calibrating and Testing Your Smoke Alarm System

Sensor Calibration Expose the sensor to different smoke concentrations. Record ADC readings for safe and unsafe smoke levels. Adjust the `SMOKE\_THRESHOLD` in the program accordingly.

Testing Procedure Power up the system. Simulate smoke using smoke or aerosol spray near the sensor. Observe if the buzzer activates. Remove smoke source and verify if the alarm deactivates. Test the indicator LEDs for status feedback.

Enhancing Your Smoke Alarm System

How a Microcontroller-Based Fire Alarm Works: Step-by-Step

Understanding the operation of such a system involves examining its logical flow:

- Sensor Data Acquisition** The microcontroller continuously reads data from connected sensors. For instance, smoke sensors output an analog voltage proportional to smoke concentration, while temperature sensors provide voltage or digital signals corresponding to temperature levels.
- Data Processing & Analysis** Using pre-defined thresholds or sophisticated algorithms, the microcontroller interprets sensor data. For example, if smoke concentration exceeds a certain level or temperature surpasses safe limits, the system recognizes a potential fire hazard.
- Decision Making** The microcontroller's firmware contains logic to determine whether the detected signals genuinely indicate a fire. It may incorporate delay timers, multiple sensor checks, or pattern recognition to reduce false alarms.
- Activation of Alerts** Upon confirming a threat, the system activates connected alert devices—sounding alarms, flashing LEDs, or displaying messages. It may also initiate communication protocols to notify security personnel or emergency services.
- Data Logging & Remote Monitoring** Advanced systems record events for maintenance and analysis. Remote monitoring features enable facility managers to oversee system status and respond promptly to alarms.
