- 1. Atomic Structure and the Periodic Table** Understanding atomic structure is fundamental to chemistry. Key ideas include:
 - Electron configurations.
 - The periodicity of element properties.
 - Trends across periods and groups.**Sample Question and Answer** Q: Explain how the atomic structure influences the chemical properties of elements in the same group. A: Elements in the same group have similar valence electron configurations, which determine their chemical reactivity. For example, alkali metals all have one electron in their outermost shell, making them highly reactive and similar in chemical behavior.
- 2. Bonding and Structure** Bonding theories explain how atoms combine to form molecules and solids. Ionic bonding involves electrostatic attraction. Covalent bonding involves sharing electron pairs. Metallic bonding features a 'sea of electrons.'
- Sample Question and Answer** Q: Describe the differences between ionic and covalent bonds. A: Ionic bonds form between metals and non-metals through the transfer of electrons, resulting in charged ions attracted electrostatically. Covalent bonds involve sharing electrons between non-metal atoms, resulting in molecules with specific shapes and properties.
- 3. Energetics**

and Thermodynamics This includes understanding enthalpy changes, Hess's Law, and energy profiles. Enthalpy changes are affected by bond energies. Exothermic and endothermic reactions. Sample Question and Answer Q: How does bond enthalpy influence the overall enthalpy change of a reaction? A: The overall enthalpy change depends on the sum of bonds broken and formed. Breaking bonds requires energy (endothermic), while forming bonds releases energy (exothermic). The net change is calculated by subtracting the energy needed to break bonds from the energy released when new bonds form.

4. Kinetics and Equilibria Key ideas involve reaction rates, factors affecting them, and dynamic equilibrium. Catalysts lower activation energy. Le Châtelier's Principle predicts how systems respond to changes. Sample Question and Answer Q: What effect does increasing temperature have on the position of equilibrium in an exothermic reaction? A: Increasing temperature shifts the equilibrium position to favor the endothermic direction, reducing the yield of the exothermic product, according to Le Châtelier's Principle.

5. Acids, Bases, and pH Understanding the behavior of acids and bases, pH calculations, and titrations. Acid-base theories (Arrhenius, Brønsted-Lowry, Lewis). Buffer solutions and their applications. Sample Question and Answer Q: Calculate the pH of a solution with a hydrogen ion concentration of $1 \times 10^{-3} \text{ mol/dm}^3$. A: $\text{pH} = -\log[\text{H}^+]$ $\text{pH} = -\log(1 \times 10^{-3}) = 3$
